

Interview Question

- Q1. What is spring framework?
- Q2. explain feature of spring framework?
- Q3. Explain modules of spring framework with brief introduction?
- Q4. what do you mean by dependency injection?
- Q5. explain types of dependency injection with examples?
- Q6. what is spring IOC container?
- Q7. What is spring bean class?
- Q8. How many ways to configure spring bean class?
- Q9. Explain setter injection, constructor injection, object dependency, collection dependency, map dependency?
- Q10. Explain bean scope with example?
- Q11. what is auto wiring and explain types of auto wiring in spring framework?

Assignments

Example1: WAP to create spring core which display Hello World Application

Example2: WAP spring application create class name as Employee with id name and sal and perform Setter injection using XML Configuration as well as perform setter injection using annotation?

Example3: WAP to create spring core application with class name as Employee with parameterized constructor and Employee class constructor contain three parameter id, name and sal and perform constructor injection with Employee class and also give the index of every parameter

Example4: WAP to Create spring core application with two classes name as Player and Team

Player is POJO class which contain three field id, name and run and we have Team class which contain two methods

void setPlayer (Player player): this method accepts Player class object using setter method means setter injection

void showPlayer (): this method can display the player information

Note: you have to perform object dependency using setter injection technique in spring core using XML as well as using @Autowired annotations

Example5: WAP to Create spring core application with two classes name as Player and Team

Player is POJO class which contain three field id, name and run and we have Team class which contain two methods

Team (Player player): this method accepts Player class object using constructor method means constructor injection

void showPlayer (): this method can display the player information

Note: you have to perform object dependency using setter injection technique in spring core.

Example6: Create Spring core Application for manage the collection dependency using list collection means you have class name as Shop with two methods

void setProducts (List<String> list): this method accepts all product using list collection

void showList (): this method can display the all products from list collection

Note: Perform collection dependency using XML.

Example7: Create Spring core Application for manage the collection dependency using set collection means you have class name as Shop with two methods

void setProducts (Set<String> set): this method accepts all product using set collection

void showList (): this method can display the all products from list collection

Note: Perform collection dependency using XML

Example8: Create Spring core Application for manage the collection dependency using map collection means you have class name as Shop with two methods

void setProducts (Map<Integer,String> map): this method accepts all product using map dependency means you have to pass data of product in the form of key and value pair to setter function.

void showList (): this method can display the all products from list collection

Note: Perform collection dependency using XML

Example9: WAP to Create spring core application with two classes name as Player and Team

Player is POJO class which contain three field id, name and run and we have Team class which contain two methods

void setPlayer (Player player): this method accepts Player class object using setter method means setter injection

void showPlayer (): this method can display the player information

Note: in this application you have to use auto wiring technique using XML as well as using @Autowired annotations.

Example10: WAP to create class name as Test and set its scope as singleton using XML as well as using annotations

Example11: WAP to create class name as Test and set its scope as prototype using XML as well as using annotations.

Interview Question

Q1. Explain the following annotation with example

@Configuration, @Bean, @Value @Autowired @Component @Service @Repository
@Qualifier @Scope @Lookup

Q2. what is use of Qualifier annotation explain with example?

Q3. what is bean life cycle and explain it with example?

Q4. How many ways to configure the bean life cycle practically or implement bean life cycle practically?

Note: you have to implement bean life cycle by using XML, by using Programming Approach as well as by using Annotations

Q5. What is difference between BeanFactory and ApplicationContext IOC Container?

Q6. How many modules are there in Spring Framework and what are they?

Q7. What is diff between constructor injection and setter injection?

Q8. In which scenario you will be use singleton or prototype scope?

Q9. What is use the use of @Required Annotations?

Q10. As singleton bean as thread safe?
